WELLSTOX

Wellstox Healer

What is WELLSTOX HEALER?

The Wellstox Healer, which regenerates the inside of skin cells, is a “skin restoration healer” that delivers Polynucleotide(PN), a biocomposite to the inside of the skin, improving physiological conditions inside the damaged skin and brings out profound beauty.

Main Component PN(Polynucleotide) 2% • **Purpose of use** Wrinkles, elasticity, and skin tone improvement

Recommended area Entire facial area • **Relative viscosity** ○ ● ●

Capacity/Packing Unit 2cc * 2syringes / box

What is PolyNucleotide, PN?

DNA fraction of a certain size extracted by DoT patented technology from wild-caught salmon returning to the East Coast of Korea.

Biocompatible substance that is heat-stable and safe in the body.

A colorless and transparent liquid in the form of GEL that maintains a certain viscosity.

It maintains a constant form in the body and gradually decomposes.

Effect of naturally improving facial wrinkles and skin.

Advantages of PN

Improve the skin environment, improve skin elasticity and skin tone.

Increase VEGF: Regenerate damaged skin environment by improving blood circulation in the skin.

Increased Fibroblast: Promotes intradermal protein secretion (collagen production).

ECM regeneration and tissue restoration: fundamentally healthy and elastic skin.

It is a high-purity product refined from high-quality raw materials with patented technology, and there is no immune reaction.

Daily life possible with short downtime after surgery (injection marks disappear within 24 hours)

Safety of PN

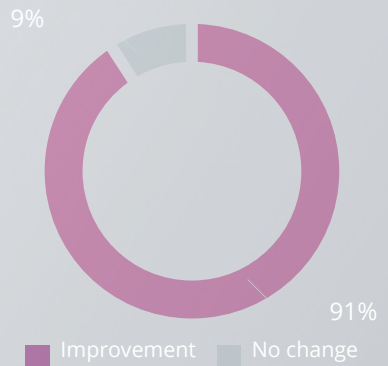

Wellsox applied DoT, a patented DNA processing technology, and was manufactured with specific standards and high purity under thorough process management.

Wellstox treatment area

Non/clinical information

Expert evaluation of improvement

- In the expert improvement evaluation, 91% of the medical staff judged that the improvement was improved. (Reduction of fine wrinkles on the skin surface observation of skin improvement around the eyes, cheeks, and neck.)

Evaluation VAS satisfied by subject : 7.1 points

- (0-10 points subjective evaluation)

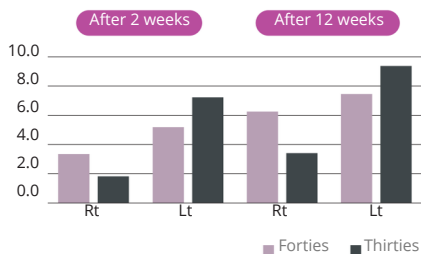

Wellstox treatment method

- Procedure protocol
2~4cc / times based on full face
2~4 weeks interval, maintenance after a total of 3 treatments (6-month interval)
Skin anesthesia (cream) -> treatment
-> sedation management
- Injection depth
Superficial dermis, intradermal
- Injection amount (per point)
0.02~0.05mL
- Injection interval
0.5~2cm (one from the other)
-

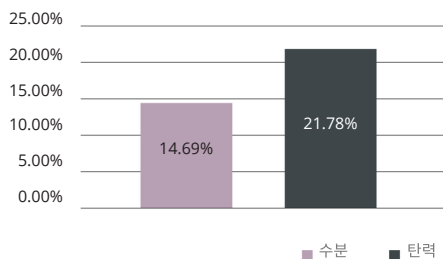

Whole face

Neck

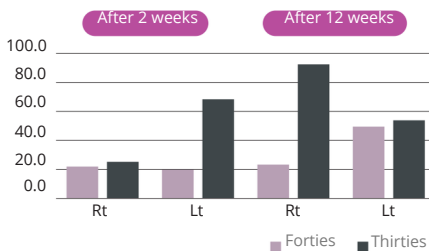

Skin thickness assessment

As a result of observing the thickness and density of the dermis with a skin scanner(skin ultrasound), the thickness and density of the dermis of all subjects increased compared to before the procedure.

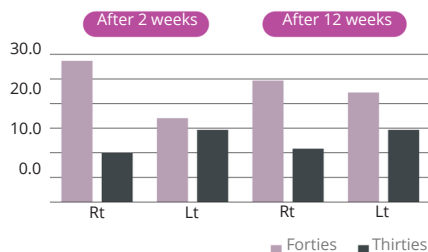

Hydration and elasticity improvement rate

Hydration : 14.7% improvement after treatment /
Elasticity : 21.8% improvement

Pore improvement (% , mean)

The number and size of pores in the cheek area also tended to decrease in all groups compared to before the procedure. In particular, the result of 12 weeks after the procedure showed a greater improvement than immediately after the procedure.

Melanin Reduction Assessment

Facial Intradermal injection of PN induces skin tone improvement by inhibiting melanin production and improving skin environment. The difference in efficacy between the left/right side may be affected by individual lifestyles, but both the left/right side showed improvement in skin tone compared to before treatment.
